Software Engineer | Meow

Cover letter

Hi Meow team,

I like your framing that the financial system is one giant state machine. I learned that lesson in a less conventional setting: during a live Quadrillion Art launch, I wrote a PostgreSQL connector so I could track purchases alongside delivery and payouts to artists and the team. When a workflow is moving money, the job isn't just getting a request to succeed. It's being able to explain what happened when something stops halfway through.

I came up through systems engineering and started Technomancy IT to build software closer to the people using it. For NuPrice, I built and operated a SaaS product that turned marketplace data and customer rules into repricing decisions. I also handled billing and support, so I heard directly when the product didn't behave as expected. On Proofmark, I worked across the React UI, PostgreSQL and API layers on a signing flow with routing, verification and webhooks. Those jobs taught me to think about the whole workflow, not just the part in my editor.

Meow's combination of business accounts, cards and crypto payments is what makes this interesting to me. I'd like to build features where the states and failure paths are understandable to customers and support, then hear from the people using them after launch. TypeScript, React, PostgreSQL and AWS are familiar ground for me. Python hasn't been my main backend language, and I'd ramp into FastAPI rather than claim I already know your stack end to end.

Thanks,
Chad Koslovsky
